❯ RETAIL MANAGEMENT

Increase sales by delivering an effective & efficient in-store experience

The Retail Management/Point of Sale module brings a new level of automation to the retail sales process. It acts as a counter sales system and is dependent on the receivables module to function and can also interact with the inventory management and CRM modules to give businesses the power they need to operate more efficiently.

This module prepares taxable and non-taxable invoices for both cash and AR customers. Cash customer information can be transferred to the Customer Information module to allow you to gather data for future marketing campaigns. As invoices are entered, the system automatically calculates applicable taxes and discounts.

The retail management module provides the ability to generate estimates or put an invoice on hold to be retrieved later for final processing. Picking tickets and receipts may be printed in either a 40 or 80 column format. This module also has an option to allow viewing item detail such as discounts, references, warehouse quantities and serial data. Preset items can be established and used to represent non-inventory items such as delivery or set up fees or presets can be a shorthand way of retrieving inventory items. Kits may be built on the fly for items that are priced as a package deal and it is easy to control what detail prints on the invoice for a given kit.

KEY FEATURES

- CASHIER DRAWER RECONCILIATION
