## Disaster Recovery Plan & Backup Strategy

Vulnerabilities of system components to security and availability breaches and incidents due to malicious acts, natural disasters, or errors are monitored and evaluated and countermeasures are implemented to compensate for known and new vulnerabilities. All logical access security measures have been implemented to protect against security and availability threats from sources outside the boundaries of the system. Business recovery plans are tested annually. Internal and external vulnerability scans are performed quarterly and annually and their frequency is adjusted as required to meet on going and changing commitments and requirements.

Controls have been implemented to prevent or detect and act upon the introduction of unauthorized or malicious software.

The transmission, movement, and removal of information are restricted to authorized users and processes, and are protected during transmission, movement, or removal enabling the entity to meet its commitments and requirements. VPN, SSL, secure file transfer program (SFTP), and other encryption technologies are used for defined points of connectivity and to protect communications between the processing center and users connecting to the processing center from within or external to customer networks. All backup media are encrypted during creation.

## FieldTrac – Field Force Management Application
